## Abstract of JP 2000128752 (A)

**PROBLEM TO BE SOLVED:** To obtain the subject promoter safe even if used in compositions for oral cavity or foods/drinks, capable of effectively promoting the recalcification of decalcified tooth enamel and positively inhibiting dental caries.

**SOLUTION:** This recalcification promoter comprises, as active ingredients, a sugar alcohol and calcium secondary phosphate (and sea algae and/or extract therefrom); wherein the sugar alcohol is pref. xylitol, while the sea algae pref. glue plant because of having significant effect. The other objective composition for oral cavity and food/drink are each obtained by adding the above recalcification promoter, or separately adding a sugar alcohol and calcium secondary phosphate (and sea algae and/or extract therefrom).
